

Fullstack Home Assignment

Thank you for applying. We appreciate the effort you are putting into this assignment. The task comes with a **4-day** deadline and is estimated to take about 4 to 5 hours to complete.

Please create both back & front - end. At the end of your work, upload the project to a git repository of your choice.

Technical requirements

- Use stable versions
- Built with best practices in mind
- You are free to use any programming language, libraries, frameworks, or infrastructure
- Use known state management tools that fit the project's business requirements
- Well-optimized
 - Lightweight
 - Fast
- Any configuration that the user might want to change, need to be managed by a file (Like forecast generation interval)
- Using database for the data
- A working **Docker** image which includes a fully working DB
- Well-designed UI and effective UX - **Bonus**

Business logic & Functional requirements

A KFC restaurant aims to improve operational efficiency by predicting daily sales, helping cooks prepare products in advance and reduce waste.

- Create a service that generates a forecast sales prediction daily per store
- Each store has multiple products
- Sales prediction data must include the time (per hour), product and related store
- The algorithm is an avg calculation
- The generator runs once a day and creates sales predictions for the next day
- The system should allow retrieval of forecasts by specific date:
 - For a specific store
 - For a specific date
- Expose a **UI** to display forecasts
 - Show a list of available stores
 - Allow to choose the forecast date to display
- Data should be persist to the user

Good Luck!
